Autumn 1964

Cedric G. Godwin

The original hole was drilled conventionally with diamond crown and had very poor recovery of the superficial deposits. A second hole was then put down a few feet away and dry-cored, producing a reasonable recovery at this level.

Site on SK 46 NE

In dry-cored hole:

Soil, dark brown, with grass growing in the top; passing down to subsoil; total recovery 8" Clay, brown, appears structureless: 1/2 recovered Clay, mottled, often silty, often with abundant fragments of sandstone, mudstone, iron-impregnated silt, and red shale; recovery of clay limestone; it suggests that the clay is brownish at top, with marked grey bands 17-20 and below; the rock fragments are angular and up to about $1\frac{1}{2}$ in diameter; much of the core is wet 20 24 10 26 0 Mudstone, mid-grey, crushed and listricised 26 COAL, only traces recovered

DRIFT

WESTPHALIAN B

In diamond-cored hole:

Mudstone, crushed grey

Broken strata, total recovery about 3/-; mainly silty mudstone with ironstones; compact beds with plant debris at base;

| | laminated lenses of siltstone at top | 3 | 0 | 170 | |
| | Mudstone, grey, micaceous; no fossils | | | | |
| | seen above 176/-; plant debris below | 7 | 6 | 177 | |
| | Mudstone, grey (but less pale), less micaceous, passing to about mid-grey | | | | |
| | below 181/-; ironstone bands below | | | | |
| | 181/-; very scattered plant debris | 7 | 0 | 184 | |
| | Mudstone, mid-grey to rather dark, shaly, | | | | |
| | with scattered ironstone bands; guilielmites from 187/6 and scattered | | | | erek. Ert |
| | ill-preserved mussels at the base | 2 | 3 | 186 | |
| | Mudstone, pale brownish grey, listric, | | | | |
| | rooty, but roots ill-preserved, and | | | | |
| | listric surfaces not abundant; rather silty bed | 4 | 9 | 188 | |
| | Mudstone, grey, silty and rather silty, | | 7 | 100 | |
| | micaceous; top seatearth-like with | | | | |
| | small listric surfaces and many roots; | | | | |
| | abundant ironstone, often in large masses/nodules; base (below 194/-) | | | () | |
| | silty with laminae of siltstone | 7 | 6 | 196 | |
| | Sandstone, greyish, silty, with laminae | eri. Shiring | | | |
| | and bands of silty mudstone in the | | | | |
| | lower half | 1 | 0 | 197 | |
| | Mudstone, grey, compact at top, and micaceous above 204/6; an odd root or | | | | şa ç |
| | two near the top, and occasional | | | | |
| | comminuted plant remains; below 201/6 | | | | |
| | softer, and slightly less pale, with | | | | |
| | wery scattered mussels in lowest 6" Mudstone, mid-grey to rather dark grey, | 12 | 3 | 209 | |
| | with scattered mussels; several of | | | | |
| | these are seen on the outside of the | | | | |
| | core; the appearance of many fossils | | | | |
| | is belied by the core itself, which | | | | |
| | | | | | |
| | | 3 | + | Maria | |

| WESTPHAUAN В | Brought forward was, on the whole, barren; much of it, as 210/6 - 211/9, is shaly; in this shaly bed, no fossils were seen; mussels are more frequent than usual in the beds 214/9 - 215/5; lowest | 6 Ms y 26 S.W. | 209 | |
|--------------|---|-------------------|-------------------|--------|
| | foot more compact and less shaly Mudstone, mid-grey, darker at top and base; wisps of irony silt in the upper part; whole bed rather silty Mudstone, darker, softer (change abrupt), | 2 11 | 219 222 | 7 |
| | with rather abundant smallish mussels and ostracods; these become few in the lower part, as the rock becomes shaly Mudstone, dark grey, shaly, with a 12 | 3 1 | 225 | 7 |
| | ironstone 3" from base; a single ostracod seen COAL 3/5 Mudstone, grey, silty, rooty, tep softer | 1 0 3 5 | 226 230 233 | 7 0 |
